

Enabling Natural Language Analysis for Object-centric Event Logs

Appendix: complete per-perspective evaluation results

Setup

This appendix reports one table per object-centric perspective, each covering every evaluated LLM under the four prompting scenarios. The dataset $\mathcal{D}$ is split by object-centric perspective into *global statistics*, *events*, *objects* and *timestamps*. Each table below reports accuracy, precision, recall, F1 score, Matthews correlation coefficient (MCC) and area under the curve (AUC) for every evaluated LLM, under the four prompting scenarios: zero-shot, zero-shot with guardrails, few-shot, and few-shot with guardrails. The upper half of each table holds the two zero-shot scenarios, the lower half the two few-shot ones.

Reading the tables. Best value per column in **bold**, second best underlined, as in the published article these results come from.

Table 1. Results on the *global statistics* dataset, varying LLM and prompt engineering strategy.
